Section 1 : Coding

1. Problem Statement

Hemanth is designing a banking system for XYZ Bank. The system should allow customers to perform deposit, withdrawal, and balance inquiry operations. Implement exception handling for scenarios involving invalid transaction amounts or insufficient funds.

Create two custom exception classes, InvalidAmountException and InsufficientFundsException, both extending the Exception class.Throw an InvalidAmountException with a message if the deposit amount is less than or equal to zero.Throw an InsufficientFundsException if the withdrawal amount is greater than the available balance.Deduct the withdrawal amount from the balance if the withdrawal is successful.

Assist Hemanth in designing the program.

Input Format

The first line of input consists of a double value B, representing the initial balance.

The second line consists of a double value D, representing the deposit amount.

The third line consists of a double value W, representing the withdrawal amount.

Output Format

If the withdrawal is successful, print the amount withdrawn and the current balance, rounded off to one decimal place.

If an InvalidAmountException occurs, print "Error: [D] is not valid".

If an InsufficientFundsException occurs, print "Error: Insufficient funds".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1050.1
270.2
150.3
Output: Amount Withdrawn: 150.3
Current Balance: 1170.0

Answer

```
import java.util.Scanner;

class InvalidAmountException extends Exception {
    public InvalidAmountException(String message) {
        super(message);
    }
}

class InsufficientFundsException extends Exception {
    public InsufficientFundsException(String message) {
        super(message);
    }
```

```
}

class HDFCBank {
    private double balance;

    public static void main(String[] args) {
        HDFCBank hdfcBank = new HDFCBank();
        hdfcBank.processTransactions();
    }

    public void processTransactions() {
        Scanner scanner = new Scanner(System.in);

        try {
            balance = scanner.nextDouble();
            double depositAmount = scanner.nextDouble();
            deposit(depositAmount);

            double withdrawAmount = scanner.nextDouble();
            double withdrawnAmount = withdraw(withdrawAmount);

            System.out.printf("Amount Withdrawn: %.1f\n" ,withdrawnAmount);
            balanceEnquiry();
        } catch (InvalidAmountException | InsufficientFundsException e) {
            System.out.println("Error: " + e.getMessage());
        } finally {
            scanner.close();
        }
    }

    public void deposit(double amount) throws InvalidAmountException {
        if (amount <= 0) {
            throw new InvalidAmountException(amount + " is not valid");
        }
        balance = balance + amount;
    }

    public double withdraw(double amount) throws InsufficientFundsException {
        if (balance < amount) {
            throw new InsufficientFundsException("Insufficient funds");
        }
        balance = balance - amount;
```

```
        return amount;
    }

    public void balanceEnquiry() {
        System.out.printf("Current Balance: %.1f\n" ,balance);
    }
}
```

Status : Correct **Marks : 10/10**

2. Problem Statement

In an online shopping cart system, users can apply coupon codes during checkout to avail of discounts. However, to ensure the validity and security of coupon codes, the system enforces specific rules for their format. Your task is to implement a Java program named CouponCodeValidator that takes user input for a coupon code and validates it according to the specified rules.

Rules for Valid Coupon Code:

The coupon code must consist of exactly 10 characters.The coupon code must contain at least one alphabet (uppercase or lowercase) and at least one digit (0-9).Special characters are not allowed in the coupon code.

Implement a custom exception, InvalidCouponException, to handle cases where the entered coupon code does not meet the specified criteria.

Input Format

The input consists of a string s, representing the coupon code.

Output Format

The output is displayed in the following format:

If the entered coupon code meets the specified criteria, the program outputs

"Coupon code applied successfully!"

If the entered coupon code has less than or more than 10 characters it outputs

"Error: Invalid coupon code length. It must be exactly 10 characters."

If the entered coupon code contains only numeric or only alphabets it outputs

"Error: Invalid coupon code format. It must contain at least one alphabet and one digit."

If the entered coupon code contains special characters it outputs

"Error: Coupon code should not contain special characters."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: ABCD123456

Output: Coupon code applied successfully!

Answer

```
import java.util.Scanner;

class InvalidCouponException extends Exception {
    public InvalidCouponException(String message) {
        super(message);
    }
}

class CouponCodeValidator {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        try {
            String couponCode = scanner.nextLine();
            validateCouponCode(couponCode);
            System.out.println("Coupon code applied successfully!");
        } catch (InvalidCouponException e) {
            System.out.println("Error: " + e.getMessage());
        } finally {
            scanner.close();
        }
    }
```

```
    private static void validateCouponCode(String couponCode) throws
InvalidCouponException {

        if (containsSpecialCharacter(couponCode)) {
            throw new InvalidCouponException("Coupon code should not contain
special characters.");
        }

        if (!couponCode.matches("^(?=.*[a-zA-Z])(?=.*\\d)[a-zA-Z0-9]{10}$")) {
            if (couponCode.length() != 10) {
                throw new InvalidCouponException("Invalid coupon code length. It must
be exactly 10 characters.");
            } else {
                throw new InvalidCouponException("Invalid coupon code format. It
must contain at least one alphabet and one digit.");
            }
        }
    }

    private static boolean containsSpecialCharacter(String str) {

        return str.matches(".*[^a-zA-Z0-9].*");
    }
}
```

Status : Correct **Marks : 10/10**

3. Problem Statement

Tim was tasked with creating a user profile system that validates the user's date of birth input. The system should throw a custom exception, InvalidDateOfBirthException, if the date is not in the specified format "dd-mm-yyyy" or if it represents an invalid calendar date.

The main method takes user input, validates the date of birth, and prints whether it is valid or not.

Input Format

The input consists of a string, representing the date of birth of the user.

Output Format

The output displays one of the following results:

If the entered date of birth is valid according to the specified format, the program prints:

"[Date] is a valid date of birth"

If the entered date of birth is not valid according to the specified format, the program prints:

"Invalid date: [Date]"

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 01-01-2000

Output: 01-01-2000 is a valid date of birth

Answer

```
import java.text.ParseException;
import java.text.SimpleDateFormat;
import java.util.Date;
import java.util.Scanner;
class InvalidDateOfBirthException extends Exception {
    public InvalidDateOfBirthException(String message) {
        super(message);
    }
}
class UserProfileSystem {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        String userInput = "";

        try {
            userInput = scanner.nextLine();
            validateDateOfBirth(userInput);
            System.out.println(userInput + " is a valid date of birth");
```

```
        } catch (InvalidDateOfBirthException e) {
            System.out.println(e.getMessage() + ": " + userInput);
        } finally {
            scanner.close();
        }
    }

    private static void validateDateOfBirth(String userInput) throws
InvalidDateOfBirthException {
        SimpleDateFormat dateFormat = new SimpleDateFormat("dd-MM-yyyy");
        dateFormat.setLenient(false);

        try {
            Date dob = dateFormat.parse(userInput);
        } catch (ParseException e) {
            throw new InvalidDateOfBirthException("Invalid date");
        }
    }
}
```

Status : Correct **Marks : 10/10**

4. Problem Statement

Alice is designing a program that requires users to enter positive numbers. She wants to implement a solution that validates whether the entered number is positive. In case the input is not a positive number, she wants to throw a custom exception.

The number should be a positive integer.If this condition is violated, the program should throw a custom exception:InvalidPositiveNumberException with the message "Invalid input. Please enter a positive integer."

Implement a custom exception, InvalidPositiveNumberException , to handle cases where the entered number does not meet the specified criteria.

Input Format

The input consists of an integer value 'n', representing the entered number.

Output Format

The output is displayed in the following format:

If the validation passes, print

"Number {number} is positive."

The {number} represents the entered positive integer.

If the entered number is negative then it displays

"Error: Invalid input. Please enter a positive integer."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 100
Output: Number 100 is positive.

Answer

```
import java.util.Scanner;
class PositiveNumberValidator {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        try {
            int number = scanner.nextInt();
            validatePositiveNumber(number);
            System.out.println("Number " + number + " is positive.");
        } catch (InvalidPositiveNumberException | java.util.InputMismatchException
e) {
            System.out.println("Error: " + e.getMessage());
        } finally {
            scanner.close();
        }
    }

    private static void validatePositiveNumber(int number) throws
```

```
InvalidPositiveNumberException {
        if (number <= 0) {
            throw new InvalidPositiveNumberException("Invalid input. Please enter a
positive integer.");
        }
    }
}
class InvalidPositiveNumberException extends Exception {
    public InvalidPositiveNumberException(String message) {
        super(message);
    }
}
```
