Attempt : 1

Total Mark : 40

Marks Obtained : 40

Section 1 : Coding

1. Problem Statement

Neha is analyzing text messages to identify words that have repeated characters. A word is considered “repetitive” if any character appears more than once in that word.

Your task is to write a program that extracts all words that contain repeated characters from a given sentence.

If no such word exists, print "No repetitive words found".

Input Format

The input contains a single line containing a sentence with multiple words.

Output Format

The output prints all words that contain repeated characters separated by a space.

If no word contains repeated characters, print "No repetitive words found".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: letter balloon apple tree

Output: letter balloon apple tree

Answer

```
import java.util.Scanner;
class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String sentence = sc.nextLine();
        String[] words = sentence.split(" ");
        boolean found = false;

        for (String word : words) {
            if (hasRepeat(word)) {
                System.out.print(word + " ");
                found = true;
            }
        }
        if (!found) {
            System.out.println("No repetitive words found");
        }
    }

    static boolean hasRepeat(String word) {
        for (int i = 0; i < word.length(); i++) {
            for (int j = i + 1; j < word.length(); j++) {
                if (word.charAt(i) == word.charAt(j)) {
                    return true;
                }
            }
        }
        return false;
    }
}
```

```
}
```

Status : Correct

Marks : 10/10

2. Problem Statement

In a university library, librarians need to track the usage of special characters in students' notes.

To help them, you are asked to write a program that counts the number of specific symbols in each passage of text.

The symbols of interest are:

Exclamation marks (!) Colons (:) Semicolons (;)

Input Format

The first line of input contains an integer T, representing the number of test cases (passages).

Each of the next T lines contains a single passage of text.

Output Format

For each test case, print three integers separated by spaces, representing the number of exclamation marks, colons, and semicolons in the passage.

The first line of output corresponds to the first passage, the second line to the second passage, and so on.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1

Hello! How are you

Output: 1 0 0

Answer

```
import java.util.Scanner;
class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int T = Integer.parseInt(sc.nextLine());

        for (int i = 0; i < T; i++) {
            String line = sc.nextLine();
            int ex = 0, col = 0, semi = 0;

            for (char ch : line.toCharArray()) {
                if (ch == '!') ex++;
                else if (ch == ':') col++;
                else if (ch == ';') semi++;
            }
            System.out.println(ex + " " + col + " " + semi);
        }
    }
}
```

Status : Correct

Marks : 10/10

3. Problem Statement

Riya is preparing for a vocabulary test. Her teacher told her to focus on long words in her practice sentences, specifically words that have at least 5 letters.

Riya wants to write a program that will help her identify such words quickly.

Your task is to help Riya by printing all the words in a given sentence that have a length greater than or equal to 5.

If no such word exists, display "No long words found".

Input Format

The input contains a single line containing a sentence with multiple words.

Output Format

The output prints all words having length ≥ 5 , separated by a space.

If no such word is found, print "No long words found".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: The quick brown fox jumps over the lazy dog

Output: quick brown jumps

Answer

```
import java.util.Scanner;
class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String sentence = sc.nextLine();
        String[] words = sentence.split(" ");
        boolean found = false;

        for (String word : words) {
            if (word.length() >= 5) {
                System.out.print(word + " ");
                found = true;
            }
        }
        if (!found) {
            System.out.println("No long words found");
        }
    }
}
```

Status : Correct

Marks : 10/10

4. Problem Statement

Anjali is preparing a report on text complexity. She wants to identify all words in a sentence that contain at least one digit so she can analyze numeric mentions.

Your task is to write a program that extracts and prints all words containing at least one digit from a given sentence.

If no such word exists, print "No words with digits found".

Input Format

The input contains a single line containing a sentence with multiple words.

Output Format

The output prints all words containing at least one digit separated by a space.

If no word contains a digit, print "No words with digits found".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: The model X100 and Y200 are available

Output: X100 Y200

Answer

```
import java.util.Scanner;
class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String sentence = sc.nextLine();
        String[] words = sentence.split(" ");
        boolean found = false;

        for (String word : words) {
            if (word.matches(".*\\d.*")) {
                System.out.print(word + " ");
                found = true;
            }
        }
        if (!found) {
            System.out.println("No words with digits found");
        }
    }
}
```

}
